

Demonstration of Editing

STA302 Project 3

1. Who was involved in the editing process:

The first and second introductions were written by Ally Shin, who oversaw the editing process. Hyeonsoo Shin and Jimin Lee provided comments and suggestions. The group worked together to improve overall flow, clarity, and conciseness by putting the strategies they had acquired in the second class into practice.

2. Editing technique used and reason for choice:

For the editing process, we focused on the three pillars of strong writing: simplicity, clarity, and elegance. Simplicity helped make the writing light and accessible, clarity ensured the text was sharp and focused, and elegance aimed to improve the flow of the writing. To achieve this, we used ChatGPT as a tool to provide suggestions for refining sentences, eliminating redundancies, and enhancing readability. After receiving advice from the tool, we edited the text on our own to align it with the academic tone and purpose of our project. This ensured the introduction was engaging, well-organized, and professional while maintaining originality.

3. Focus area:

The editing process primarily focused on simplicity by eliminating unnecessary details and enhancing sentence structure. Simplicity was prioritized because it made the writing lighter, faster to read, and more accessible to a broader audience. By streamlining ideas and avoiding overly complex phrasing, we aimed to ensure the introduction delivered its message clearly and effectively.

4. Edited introduction example:

Original (from Project 1):

The first paper, North and Krause (2024), researched if the songs of The Beatles, the most iconic rock band of the 1960s, are different from the other songs, examining acousticalness, danceability, duration, energy, key, loudness, mode, popularity, tempo, and valence. It concluded that louder, and more positively valenced tracks of The Beatles were related to greater popularity (p. 133).

Edited (from Project 3):

North and Krause (2024) investigated the distinctiveness of The Beatles' music compared to others. They found that louder tracks with positive valence correlated with higher popularity (p. 133), highlighting the significance of emotional and dynamic features.

5. Reflection on the editing process:

The introduction became more concise and professional after eliminating repetitive words and simplifying the sentence structure. The updated version improved readability and impact by succinctly expressing the study topic and its significance in fewer words.

It was difficult to strike the balance between cutting the word count and keeping important details. We had to carefully reword sentences to keep the essential idea concise and unambiguous. It also took a lot of work to shorten phrases while keeping an intellectual tone.
